Space Weather Forecast

Issued on Monday 3 February 2025 at 01:04 Local

This forecast provides a four-day assessment of space weather events. The probabilities stated below are for reaching or exceeding the given levels. For more information about space weather impacts please see the Met Office Space Weather Scales https://www.metoffice.gov.uk/weather/learn-about/space-weather/uk-scales

---

Space Weather Forecast Headline: Fast solar winds easing. Further Moderate-class flares expected.

Analysis of Space Weather Activity over past 24 hours

Solar Activity: Solar activity was High over the last 24 hours with six Moderate-class flares, the largest peaking at 02/1404 UTC from a region in the northeast.

There are up to ten active regions on the Earth-facing disc, eight of which are numbered. The majority of the activity is from the cluster of sunspots in the northeast, now consisting of five bipolar groups. These form a complex area of multiple active regions, with signs of magnetic interaction between the regions suggesting the ongoing potential for notable flares. The eastern-most of these regions is showing rapid growth and increasing magnetic complexity. The remaining spot groups are small and magnetically simple, with either limited evolution or slow decay.

No coronal mass ejections (CMEs) that left the Sun in the past 24 hrs are currently expected to have an Earth-directed component.

Solar Wind / Geomagnetic Activity: Solar winds showed a declining connection to a fast solar wind stream. Wind speeds were initially strong around 700 km/s, falling to around 500 km/s. The Interplanetary Magnetic Field was initially weak but increased to moderate levels after 02/1600 UTC. The north-south component was initially weakly variable before becoming moderately positive. Geomagnetic activity was Quiet to Active (Kp2-4).

Energetic Particles / Solar Radiation: The count rate of energetic particles (high energy protons) persisted at background levels with no solar radiation storms occurring.

Four-Day Space Weather Forecast Summary

Solar Activity: Generally Moderate activity is expected, with Moderate flares expected at times and a slight chance of isolated Strong flares, primarily from the regions on the northeast disc.

Solar Wind / Geomagnetic Activity: There is one CME in the forecast which could give a glance early on Day 1 (03 Feb), however this is later than initially forecast and as such is low confidence.

Earth is currently connected to fast solar winds, with speeds currently around 530km/s, however a declining trend has been observed as Earth moves out of these fast winds. Wind speeds expected

to continue easing during Days 1-2 (03-04 Feb), returning to generally slightly elevated or background levels by Day 3-4 (05-06 Feb).

Generally Quiet to Unsettled (Kp2-3) geomagnetic activity is expected as Earth continues to come out of the coronal hole high speed stream, with a chance of Active (Kp4) intervals on Day 1 (03 Feb). A decreasing slight chance of G1/Minor Storm (Kp5) intervals remains if any CME glance is observed early on Day 1. Activity then expected to ease further from Day 2 (04 Feb) onwards, becoming generally Quiet (Kp1-2).

Energetic Particles / Solar Radiation: The count rate of energetic particles (high energy protons) is likely to remain at background levels. However, there is a slightly increasing risk of a rise through this period, as the complex of sunspots in the northeast disc move into the western hemisphere.

Geomagnetic Storms

Geomagnetic Storm Probability (Exceedance)	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Minor or Moderate	G1 to G2	No	15	5	5	5
Strong	G3	No	1	1	1	1
Severe	G4	No	1	1	1	1
Extreme	G5	No	1	1	1	1

Radio Blackouts - X-Ray Flares

X-Ray Flares Probability	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Active	R1-R2 (M Class)	Yes	75	75	75	75
Very Active	R3-R5 (X Class)	No	15	15	15	15
